EXERCICE 1

Let $k(x) = \dfrac{x-1}{x+3}$.

1. Can we compute $k(-3)$? Answer must be properly justified.

2. Show that the rate of change $t(h)$ of function k at $a = 2$ is equal to :

$$t(h) = \frac{4}{5h+25}.$$

3. Use this result to calculate $k'(2)$.

4. Give an equation of the tangent line of the curve of fonction k at point $\Big(2, k(2)\Big)$.
